### 1. Introduction

#### 1.1 Domaine

Nous avons choisi d'aborder le thème de la cuisine pour ce projet. En effet, c'est non seulement une activité qui nous unit tous mais également qui fait partie intégrante de notre quotidien. Dans le vaste univers culinaire, nous avons spécifiquement sélectionné le fait de monter les blancs d'œufs en neige car c'est une tâche en apparence simple mais qui est, finalement, loin d'être évidente à maîtriser pour la réussir à tous les coups.

#### 1.2 Problématique

« Monter les blancs en neige » est donc la tâche que nous avons choisi de modéliser. L'idée est d'obtenir une texture parfaite de blanc d'œufs en neige, c'est-à-dire qui soit ferme, non liquide, avec une couleur proche du blanc et un aspect très aéré. Nous pourrons alors jouer sur plusieurs paramètres tels que la vitesse pour fouetter les blancs, le geste utilisé et le temps passé à fouetter. Afin qu'il soit le plus proche possible d'un comportement humain, notre modèle ne pourra pas fouetter à une vitesse trop élevée ni pendant trop longtemps. C'est pourquoi nous avons décidé de prendre en compte la fatigue accumulée au cours du temps.

Nous avons également défini des hypothèses de départ, que l'on va considérer comme étant admises pour la suite, ce qui évitera de trop complexifier notre modèle :

- Tous les ingrédients et ustensiles sont à disposition
- Le plan de travail est en place, prêt à être utilisé
- Notre modèle sait compter

# 2. Représentation des connaissances

#### 2.1 Buts

#### 2.1.1 But principal

Le but principal de notre modèle est d'obtenir des blancs en neige. Pour l'atteindre, celui-ci doit réaliser deux sous-buts : n'avoir que des blancs d'œufs et les battre jusqu'à obtention de la texture souhaitée. Notre modèle, au départ, dispose d'un certain nombre d'œufs à battre ainsi que d'une réserve d'énergie qui va décroître au fil du temps. Si la texture parfaite n'est pas obtenue avant que l'énergie ne tombe à 0, le modèle échoue à atteindre son but principal et s'arrête.

#### **But principal**:

# (chunk-type butAvoirBlancsEnNeige statut)

#### 2.1.2 Sous-buts

Notre premier sous-but est l'obtention de blancs d'œufs uniquement. Lors de ce sous-but, il va non seulement falloir casser les œufs dans le récipient mais également les séparer pour ne conserver que le blanc. Lors de cette opération, il est probable que certains résidus de coquilles et de jaune se

## IFT609 – Informatique Cognitive

retrouvent mêlés à nos blancs, il faut donc prendre en compte, si besoin, le nettoyage du mélange avant de passer au sous-but suivant.

#### Premier sous-but:

# (chunk-type butAvoirBlancs nbBlancs nbJaunes nbCoquilles statut)

Une fois ce sous-but réalisé, nos blancs sont en place dans le récipient et nettoyés d'éventuels résidus de coquilles ou de jaune. Notre modèle va pouvoir les battre pour obtenir l'aspect en neige. Obtenir une texture en neige est donc notre second sous-but. Différents paramètres vont alors entrer en jeu pour prendre en compte la vitesse d'exécution, le geste réalisé et le temps passé à fouetter. C'est à partir de ce sous-but que l'énergie disponible dans le but principal va commencer à décroître.

#### Second sous-but:

(chunk-type butObtenirTexture couleurActuelle volumeActuel vitesseActuelle energie statut)

#### 2.2 Types de chunks

#### 2.2.1 La texture

Ce chunk texture correspond à la texture parfaite de blancs en neige que l'on souhaite atteindre. Elle est caractérisée par une couleur proche du blanc, une certaine consistance ainsi qu'une densité. Ces deux derniers paramètres nous permettent d'indiquer les critères d'une texture ferme et aérée.

#### Texture:

# (chunk-type texture couleur volume)

#### 2.2.2 L'expérience de fouettage

L'expérience de fouettage enregistre toutes les tentatives de notre modèle pour monter les blancs en neige lors d'un run. C'est ce chunk qui va lui permettre un apprentissage, en essayant à chaque tentative de tendre vers le chunk texture, énoncé précédemment comme la texture parfaite à obtenir. Pour modéliser cela, nous avons choisi d'enregistrer la texture obtenue par notre modèle en fonction de la couleur actuelle, du volume actuel mais aussi de la vitesse d'exécution et du résultat obtenu.

#### <u>Expérience</u>:

(chunk-type experienceFouettage couleurActuelle volumeActuel vitesseMouvement resultat)

#### 2.3 Procédures

#### 2.3.1 startCassage

Cette procédure va permettre d'amorcer le cassage des œufs lors du démarrage du programme si butAvoirBlancs est le but sélectionné et si son statut est startCassage. Elle déclenche donc la recherche d'œuf à casser.

#### 2.3.2 attraperOeuf

Avant de casser des œufs, le modèle va visuellement les chercher dans la fenêtre graphique. Une fois l'œuf trouvé, il place son curseur dessus et change le statut du goal sur *oeufAttrape* pour simuler le geste de prendre l'œuf et le casser dans le récipient.

#### 2.3.3 casserOeufSansCoquille ou casserOeufAvecCoquille

L'une ou l'autre de ces procédures s'exécute selon l'habitude du modèle : s'il est débutant en cassage d'œufs, le risque de mettre de la coquille dans la préparation est plus grand qu'une fois le geste répété et acquis. Cela nous permet de faire un premier apprentissage via l'habitude en récompensant le modèle lorsqu'il ne met pas de coquille dans la solution. Ainsi, s'il rate son geste, c'est casserOeufAvecCoquille qui s'exécute pour mettre des coquilles dans la préparation et casserOeufSansCoquille sinon. Dans tous les cas, il passe ensuite à la séparation du jaune et du blanc.

#### 2.3.4 separerOeufSansJaune ou separerOeufAvecJaune

Le principe de ces deux procédures est le même que pour les coquilles.

#### 2.3.5 verifierPasCoquille

Cette procédure va permettre au modèle de savoir s'il y a, ou non, des coquilles dans la préparation. S'il n'y en a pas, il va pouvoir vérifier la présence de jaune.

#### 2.3.6 verifierAvecCoquille, retirerCoquille puis retirerCoquilleTermine

La procédure *verifierAvecCoquille* va indiquer au modèle qu'il y a des coquilles dans la préparation et qu'il faut donc la nettoyer pour les retirer avant de passer à la vérification de la présence de jaune. C'est ainsi que *retirerCoquille* s'enclenche, permettant donc de retirer toutes les coquilles. La procédure *retirerCoquilleTermine* va ensuite permettre de passer à la vérification des jaunes.

#### 2.3.7 verifierPasJaune

Cette procédure teste la non-présence de jaune dans la solution et permet de recommencer le processus de cassage d'œufs.

#### 2.3.8 verifierAvecJaune, retirerJaune et retirerJauneTermine

Le principe de ces procédures est le même que pour les coquilles.

#### 2.3.9 passerAuFouettage puis demarrerFouettage

Cette procédure teste s'il n'y a plus aucun œuf à casser pour ensuite commencer le processus de fouettage. Concrètement, elle change le but en cours de traitement de *goalAvoirBlancs* à *goalObtenirTexture*.

#### 2.3.10 recupererVitesseSucces

Permet de récupérer la vitesse d'une précédente tentative terminée par un succès.

#### 2.3.11 recupererVitesseSuccesOK ou recupererVitesseSuccesKO

Dans un premier temps, le modèle va essayer de se rappeler d'une expérience passée où il a réussi à obtenir une texture parfaite de blancs en neige. S'il y arrive, il récupère la vitesse de fouettage qu'il avait utilisée. Sinon, il cherchera une expérience ratée.

# 2.3.12 recupererVitesseManqueEnergieOK ou recupererVitesseManqueEnergieKO

Dans le cas où le modèle n'arrive pas à se rappeler une expérience où il a réussi à obtenir des blancs en neige corrects, il va chercher une expérience passée où il n'a pas réussi. La procédure recupererVitesseManqueEnergieOK va s'exécuter s'il arrive à se rappeler d'une précédente expérience où il a échoué. Il va alors récupérer la vitesse qu'il avait appliqué et chercher à la baisser pour réduire sa dépense d'énergie et maximiser ses chances de réussite. Dans le cas où il n'a aucune expérience, le modèle va choisir une vitesse aléatoire comme premier essai.

#### 2.3.13 baisserVitesse ou augmenterVitesse

En fonction du succès de l'expérience récupérée, le modèle va choisir de diminuer la vitesse rappelée ou de l'augmenter pour optimiser au mieux son énergie.

#### 2.3.14 fouetterClassique

Cette procédure représente le fouettage réalisé par le modèle pour monter ses blancs en neige. Elle permet de mettre à jour au fur et à mesure le volume et la couleur de la préparation en fonction de la vitesse d'exécution tout en diminuant l'énergie encore disponible. Ainsi, la texture s'améliore à chaque itération mais, en contrepartie, l'énergie du modèle diminue.

#### 2.3.15 verifierTexture puis comparerTextureOK ou comparerTextureKO

La procédure *verifierTexture* permet au modèle de se rappeler la texture parfaite enregistrée dans la base de connaissances. Ainsi, il va pouvoir se servir de cette information récupérée pour la comparer avec celle qu'il a actuellement dans son récipient. Si cette texture parfaite a été atteinte, le modèle arrête de fouetter et va enregistrer la tentative comme étant un succès. Sinon, il va chercher à continuer de fouetter pour l'atteindre mais devra d'abord s'assurer d'avoir assez d'énergie pour continuer.

#### 2.3.16 verifierEnergieOK ou verifierEnergieKO

Ces procédures permettent au modèle de savoir s'il lui reste encore de l'énergie ou non. Si c'est le cas, il continue le fouettage en exécutant *fouetterClassique*. Sinon, il arrête et selon la valeur de la texture obtenue, la tentative sera un succès ou un échec.

## 2.3.17 finirExperienceEchec ou finirExperienceSucces

Si le modèle a réussi à monter les blancs en neige, *finirExperienceSucces* sera la procédure exécutée. Elle va permettre d'enregistrer cette tentative comme un succès pour que notre modèle puisse apprendre et s'en rappeler plus tard. En revanche, s'il n'a pas réussi, c'est *finirExperienceEchec* qui s'exécutera pour enregistrer cette expérience comme étant ratée. L'enregistrement des valeurs de

couleur, de volume, de vitesse d'exécution et de résultat (échec ou succès) permettront alors au modèle d'adapter son geste pour les itérations futures.

# 3. Exécution du programme

#### 3.1 Scénario simulé

Le scénario que nous présentons dans ce rapport est le cas dans lequel le modèle n'a aucune expérience pour casser, séparer ou fouetter des œufs. Il va donc commencer par chercher les œufs, les attraper puis les casser avec une certaine probabilité de mettre des coquilles dans la solution. Puis, il va séparer le blanc du jaune d'œuf avec une certaine probabilité de mettre un peu de jaune dans la solution. Une fois ces étapes faites pour un œuf, il vérifie si des coquilles ou du jaune auraient été ajoutés à la solution et si oui, il retire les éléments non désirés. Il va répéter ce processus tant qu'il y aura des œufs dans son champ de vision.

Une fois ces étapes de cassage et de séparation effectuées pour tous les œufs, le modèle va passer au fouettage. Dans un premier temps, il va essayer de se rappeler d'une précédente expérience où sa tentative de fouettage des œufs a réussi. S'il y arrive, il utilisera cette vitesse pour fouetter les œufs. S'il ne se rappelle pas d'une tentative réussie, il va chercher une tentative où il n'a pas réussi à obtenir des blancs en neige avant de s'épuiser. Dans ce cas-là, il va réduire sa vitesse pour essayer de moins dépenser d'énergie pour atteindre une texture en neige. S'il n'a absolument aucune expérience, il va prendre une valeur de vitesse aléatoire.

## 4. Apprentissage

### 4.1 Casser et séparer les œufs

Afin de permettre à notre modèle de s'améliorer et d'apprendre de ses erreurs, nous avons mis en place deux méthodes d'apprentissage. La première est basée sur les habitudes et le principe en ACT-R de *reward*. En effet, pour que le comportement de notre modèle soit le plus humain possible, nous avons décidé qu'il serait possible qu'il fasse tomber des coquilles ou du jaune d'œuf dans la préparation au moment où il les casse et les sépare. Cette possibilité se traduit par des procédures possédant les mêmes préconditions, l'une ajoutant une coquille ou du jaune et l'autre non. Lorsqu'une de ces procédures est utilisée, un *reward* lui est appliqué dans le but de favoriser les procédures ne rajoutant pas de coquille ou de jaune dans la solution. Nous pouvons observer cela sur les graphiques ci-dessous, où 25% sur l'axe des ordonnées représente qu'en moyenne les modèles ont déposé 1 coquille ou 1 jaune au cours de l'itération donnée.

Nous avons aussi cherché à ce que cet apprentissage soit optimal après 5 itérations (soit 20 œufs cassés et séparés), tout en gardant toujours une probabilité non nulle d'ajouter des coquilles et du jaune car comme les humains, notre modèle n'est pas infaillible. Nous considérons en effet qu'après avoir cassé et séparé une vingtaine d'œufs, une personne ordinaire a appris à ne presque plus faire tomber de coquille ou de jaune. Nous avons cependant pris la décision de garder une probabilité non nulle de mal casser ou de mal séparer le jaune du blanc car nous pensons aussi qu'il arrive de temps en temps d'être maladroit.

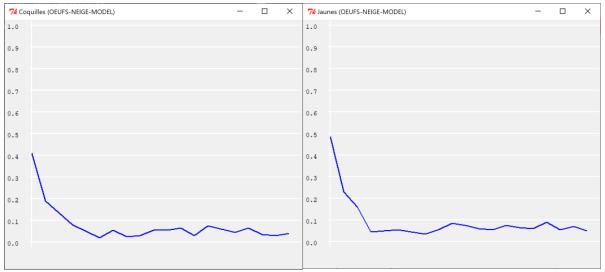

Figure 1 - Courbe d'apprentissage représentant le dépôt de coquille sur 20 itérations (80 cassage d'œufs)

Figure 2 - Courbe d'apprentissage représentant le dépôt de jaune sur 20 itérations (80 cassages d'œufs)

#### 4.2 Monter les blancs en neige

Concernant la montée des blancs en neige, nous avons choisi de nous inspirer du Lab 4 en utilisant un chunk d'apprentissage. Le chunk *experienceFouettage* permet ainsi au modèle de se souvenir de ses tentatives passées afin de progresser vers la réussite du but principal. Cette progression est réalisée dans ACT-R grâce au rappel d'une précédente expérience et à la modification de la vitesse utilisée précédemment. La génération de la vitesse par défaut, c'est-à-dire la vitesse utilisée par le modèle au cours de sa première itération, utilise deux paramètres ayant pour but, d'une part, de permettre à deux exécutions indépendantes du modèle d'être différentes, et d'autre part, de procurer une certaine flexibilité d'apprentissage au modèle : le premier paramètre est la vitesse minimale permettant en pratique de définir une vitesse par défaut minimale mais aussi de définir le point de départ pour l'apprentissage du modèle alors que le deuxième paramètre est la marge aléatoire qui représente la taille de l'intervalle dans lequel nous tirons un nombre aléatoire que nous ajoutons à la vitesse minimale. Cela permet ainsi d'avoir une vitesse par défaut propre à chaque modèle.

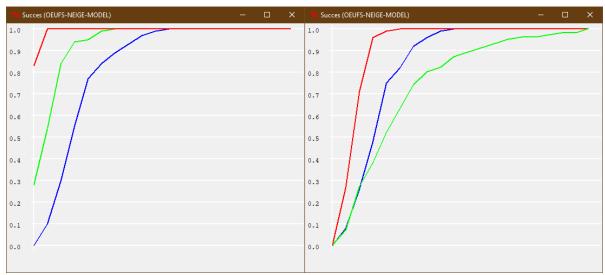

Figure 3 - Courbe d'apprentissage représentant la montée des blancs en neige au fil des itérations en modifiant la vitesse minimale

Figure 4 - Courbe d'apprentissage représentant la montée des blancs en neige au fil des itérations en modifiant la marge aléatoire

Les figures 3 et 4 ci-dessus illustrent donc les différentes courbes d'apprentissage en fonction de la valeur des paramètres fixée. Sur la figure 3, la courbe de référence, en bleu, avec une vitesse minimale de 15, nous indique qu'aucun modèle n'a réussi à monter les blancs en neige au cours de la première itération. En revanche, la courbe verte correspondant à une vitesse de 10 et la rouge à une vitesse de 5, montrent que moins de 10% des modèles n'ont pas réussi à obtenir de blancs en neige à la première itération. D'un autre côté, la modification de la marge aléatoire sur la figure 4 influe sur la progression de l'apprentissage des modèles. La courbe bleue représente, là encore, la courbe de référence avec les mêmes paramètres que la courbe bleue du précédent graphique. Nous voyons ainsi qu'en réduisant la marge aléatoire (courbe rouge), le modèle semble devenir plus performant à la tâche. A contrario, la courbe verte nous montre qu'en réduisant la marge aléatoire, le modèle a plus de difficulté à arriver aux 100% de réussite à monter les blancs en neige.

## 5. Conclusion

La réalisation de ce modèle montant des blancs d'œufs en neige n'a pas été chose aisée mais nous avons réussi à développer la totalité des objectifs que nous nous étions fixés au départ : notre modèle est en mesure de casser des œufs, séparer le blanc du jaune et fouetter les blancs jusqu'à l'obtention d'une texture en neige. Nous avons jugé intéressant d'ajouter un second type d'apprentissage, par l'habitude, pour les étapes de cassage et de séparation des œufs bien qu'il ne soit pas initialement prévu. En effet, il nous a permis de réutiliser les compétences acquises du Lab 5, ce qui complète parfaitement celles du Lab 4 que nous utilisions pour l'apprentissage du fouettage. Les résultats obtenus simulent un apprentissage plutôt cohérent avec la réalité : ils sont proches de ceux qu'un être humain pourrait obtenir.

Notre modèle n'est, toutefois, pas parfait. En effet, le nombre d'œufs pour chaque itération est fixé à 4, ce qui n'est pas très représentatif de la réalité. De plus, les paramètres fixés pour représenter la vitesse de fouettage ainsi que la couleur et le volume de la texture restent assez abstraits : ils ne sont pas basés sur des expériences que nous aurions faites en situation réelle. Le modèle mathématique choisi pour représenter le geste de fouettage manque également de réalisme. Il serait donc intéressant de mener des expériences pour mesurer ces données et modéliser au mieux la situation.

Bien que nous soyons satisfaits de notre modèle, nous avons réfléchi à d'éventuelles améliorations pour une évolution future. Au-delà de corriger les défauts de modélisation cités plus haut, nous pourrions également ajouter la possibilité d'augmenter temporairement la vitesse de fouettage, permettant au modèle de réaliser un « rush » dans un dernier espoir d'avoir la texture si celle-ci ne monte pas. Il serait également intéressant de prendre en compte un éventuel échec lors du nettoyage des jaunes, ce qui aurait un impact sur la montée des blancs. Enfin, il serait plus réaliste d'adapter l'énergie du modèle selon la forme physique de notre modèle car il se peut qu'il ne puisse pas réussir si un jour il est trop fatigué.

Finalement, notre projet est adaptable à une multitude de situations en cuisine. Il est possible de le décliner pour toutes les recettes nécessitant de casser des œufs, séparer le jaune et le blanc et fouetter la préparation telles que blanchir des jaunes, réaliser une meringue et bien d'autres.
